The influence of Age, Gender and Ethnicity on London Police forces Stop and Search Actions

DVP

Yuetong Wang

2024-6-1

33581975

1. Introduction

Stop and Search is a policy set up by the United Kingdom government. It empowers UK police officers to stop a person and conduct a full body search, which may include the removal of more than just outer clothing, by stating they are suspicious of violating the law (GOV.UK, 2011). This DVP project is aiming to identify the bias contained in the Metropolitan Police and City of London police forces' Stop and Search action in the London area. Specifically discussing the influence of age, gender, and ethnicity on police officers' search reason (object of search) and search outcomes. The results of the study show that there are significant differences in police officer's subjective decision on conducting stop and search of individuals with different demographic characteristics.

The intended audience for this project includes policymakers, law enforcement officials as well as the general public. Policymakers can use these insights to drive potential reformation of the policy to ensure fairer police practices. Police forces can better understand their impact with their behaviours being visualised. The general public, particularly in the London area, can gain a clearer understanding of bias and speak out for themselves with data.

Data used in this project is originally downloaded from the UK police data then merged, categorized and cleaned.

The influence of Age, Gender and Ethnicity on London Police forces Stop and Search Actions

AnalysisAbout the Project

About the Project

This project aims to identify London police's bias in conducting stop and search actions by analyzing the influence of gender, age, and ethnicity on police forces' search actions in London. The analysis includes visualizations such as pie charts, heatmaps, word clouds, and Sankey diagrams to provide insights into the data.

Data Source:

<https://www.ethnicity-facts-figures.service.gov.uk/crime-justice-and-the-law/policing/stop-and-search/latest/>

What is Stop and Search:

Stop and search refers to a police power that allows officers to stop an individual and search them for illegal items, such as drugs, weapons, stolen property, or items that could be used to commit a crime. This practice is intended to prevent crime and protect public safety. Stop and search is a highly subjective practice, where police officers may be influenced by stereotypes and biases. As a result, certain groups may be disproportionately targeted.

Motivation:

This project is motivated by the need to understand and address potential biases in police stop and search practices. The goal is to promote transparency and contribute to efforts to reduce discriminatory practices within police forces.

The influence of Age, Gender and Ethnicity on London Police forces Stop and Search Actions

Analysis About the Project

Data Analysis

Gender Distribution for Black

Gender Distribution for Asian

Gender Distribution for White

Gender Distribution for Other

Firstly, males are searched at a much higher rate than females which a trend that is evident across all racial groups. It reflecting the significant influence of gender in police searching behaviour. Second, race is also an important factor. For example, black and Asian males are searched at relatively high rates, while white females are identified as more suspicious than other ethnicities. Overall, the four pie charts suggest that both gender and ethnicity have a significant impact on the London Police stop and search actions.

Heatmap of Age Range and Ethnicity

According to heat map data, age significantly impacts the London police's decisions on Stop and Search. For the white ethnic group, individuals aged 25-34 are the most likely to be searched, as shown by the darkest color in that age range on the heat map. In contrast, for other ethnic groups, the highest search rates are among those aged 18-24. When looking at the total number of people searched, Whites are the most frequently searched ethnic group, followed by Blacks, Asians, and Others. This may be attributed to the fact that over fifty percent of London's population is White. However, it is worth noting that Black people are more likely to be searched compared to Asians and other ethnic groups, even though they make up approximately 10 percent less of the total London population than Asian and Other ethnicity(ONS, 2022). This indicates that race significantly influences search operations, with Black individuals being at a higher risk of being searched.

Word Cloud for Ethnicities and Objects of Search

Select Ethnicity for Word Cloud:

White

Sankey Diagram of Ethnicities and Objects of Search

Choose the object(s) of search for Sankey chart:

Offensive weapons Controlled drugs

Combining the results of the word cloud and Sankey charts, we see that the total number of searches for possession of offensive weapons among ethnicity of black equals that of white, despite black population is significantly smaller(ONS, 2022). If you select 'Firearm' in the Sankey diagram, you will notice that people with ethnicity of black is searched far more frequently than any other ethnicity. White and other ethnicities are more likely to be searched for stolen good. In contrast, Asian have a more even distribution of reasons for being searched. These data suggest that the reasons and frequency of searches are not distributed according to race as a percentage of the population.

Outcome for Ethnicity: Black

Select Ethnicity:

Black

A 'true' result means that the allegation for which the search was conducted was true. For example, if a person is searched for firearms, a True result means that the person has a firearm. Overall, ethnicity of White have the highest probability of a search result being 'True' of all ethnicities, about 40 per cent, above five percentage points higher than the other three ethnicities. Ethnicity of Other had the lowest probability, about 32.4 per cent, meaning that they were more likely to be charged with unfounded allegations.

(Overview of the project)

2.Design Process

Graph choice:

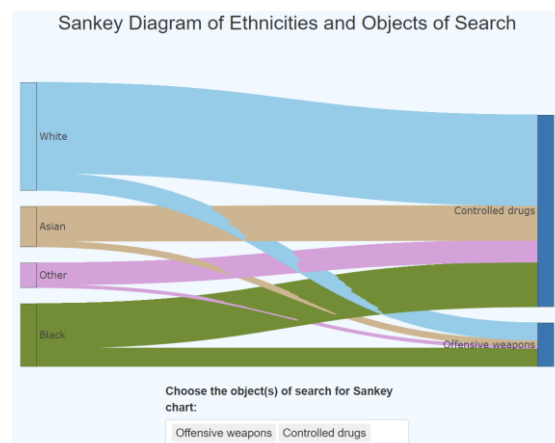

Graph choices are based on a graph webpage suggested in class: From Data to Viz (Healy, 2024). I identified the data type first than based on the webpage's advice choose effective graph type.

Pie charts:

Ethnicity and Outcome are categorical data; Search count is numerical data. Pie charts can therefore be effectively used to show the distribution of gender and search results with different chars representing distinct ethnicities.

Sankey chart:

Ethnicity and Object of search are two categorical variables from the dataset. Therefore, Sankey char can be used to effectively visualize the flow and relationship between these two variables.

Word cloud:

Ethnicity and Object of Search are both categorical variables, and by fixing one and showing the frequency distribution of the other, these relationships can be effectively visualised using Word Cloud.

All the above graphs except the pie chat for outcome came from the combination of sheet 2 3 4 from the

five-sheet design (see appendix). Each graph illustrates at least one of the factors that influence the police forces' stop and search actions.

Colour choices:

This design mainly uses distinct colour hue to assist with quick distinguishment between different categories. For example, in the pie chart blue represent male and Orange represent female. They both are strong, easily recognizable colour that stands out in a pie chart. Orange is used to contrast with blue. It is warm and bright, making it easily distinguishable from the blue segment. Colour in Sankey chart has lower colour construct than other graphs to reduce visual fatigue caused by complex graphics. The heat map mainly uses the change of colour brightness for assisting the viewer visualise the search frequency. Bright colours indicate fewer values and dark colours indicate more values.

Typographic:

In my project, a uniform font is used for all text elements to maintain consistency and readability and to ensure visual coherence throughout the page. Headings are relatively large to make it easy for users to navigate through the different sections. Some images take up the full width of the page and others take up half the page width for easy side-by-side comparisons. All images and text are centrally aligned which keeps the page clean and organised, making it easier for users to focus on the content.

Narrative:

This project mainly uses simple language to describe findings based on visualisations ensure the target audiences' understanding.

3.Implementation

3.1 Technical Implementation

Before implementing the DVP project, five sheet design has been conducted for clear guideline. The first design sheet is used for brainstorming and is responsible for coming up with ideas and screening them (Github, 2024). The second, third and fourth design sheets are the process of trying out different combinations (Github, 2024). The fifth design sheet shows the general direction and layout of the final data visualisation project (Github, 2024). More details will be provided in the appendix. The final design of this DVP did not follow the fifth design table exactly. On the one hand, I eliminated the drop-down selection on the pie charts that illustrate gender factors because the pattern of data in the four pie charts do not show significant differences, and displaying them side by side would allow for clearer comparisons. On the other hand, when I actually conducted the DVP, I found that the analysis on the outcome was missing in the fifth design table. Therefore, I added a pie chart on outcome in the final design.

Original data is merged using excel Power query and cmd from 12 folders including 24 CSV files. The final data set used contains 2206 lines and 17columns.

(Merged in Power Query)

From a technical perspective, this project is implemented by R studio assist with some packages.

- 1) Used the data.table package to export the necessary variables from the original CSV file into several smaller ones, which optimizes the runtime for the final project.

```
#London_Gender <- London_Data[, c("Gender", "officer.defined.ethnicity")]
#fwrite(London_Gender, "London_Gender.csv")
#London_Objects <- London_Data[, c("Officer.defined.ethnicity", "Object.of.search", "search_cases")]
#fwrite(London_Objects, "London_Objects.csv")
#London_Age_Eth <- London_Data[, c("Age.range", "officer.defined.ethnicity")]
#fwrite(London_Age_Eth, "London_Age_Eth.csv")
```

- 2) Read prepared files into R Studio

```
# Read file
#London_Data <- read.csv("modified_merged_london.csv")
London_Gender <- read.csv("London_Gender.csv")
London_Objects <- read.csv("London_Objects.csv")
London_Age_Eth <- read.csv("London_Age_Eth.csv")
London_Police <- read.csv("UKPolice_Force_Areas.csv")
London_Outcome <- read.csv("London_Outcome.csv")
```

- 3) Use ggplot2, wordcloud2 and plotly produce interactive graphs before define UI and Server.

```
# Define initial plots

# Sankey chart
create_sankey_plot <- function(data) {
  # Create unique nodes
  nodes <- unique(c(data$officer.defined.ethnicity, data$object.of.search))
  node_indices <- setNames(seq_along(nodes) - 1, nodes)

  # Map sources
  data$source <- node_indices[data$officer.defined.ethnicity]
  data$sink <- node_indices[data$object.of.search]

  # Define colors
  node_colors <- c("Black" = "#6b8e23", "Asian" = "#d2b48c", "White" = "#87ceeb", "Other" = "#dda0dd")

  # Create a color vector for all nodes
  colors <- rep("#ffffff", length(nodes))
  colors[match(names(node_colors), nodes)] <- node_colors

  # Create the plot using plot_ly
  plot_ly(
```

- 4) For building UI, HTML is used for common structure, fluid page is used for graph and word positioning.

```
# Define UI
ui <- fluidPage(
  tags$head(
    tags$style(
      HTML("
        /* Add Frame */
        .page-container {
          border: 2px solid #ccc;
          padding: 20px;
          background-color: #f0f8ff;
        }
        /* Center the word cloud */
        #wordcloud {
          margin: 0 auto;
        }
        /* Center the selectInput and selectizeInput */
        .input-container {
          display: flex;
          justify-content: center;
        }
      ")
    )
  ),
  titlePanel("The influence of Age, Gender and Ethnicity on London Police forces Stop and Search Actions"),
  div(class = "page-container",
    tabsetPanel(
      tabPanel("Analysis",
        fluidPage(
          titlePanel("Data Analysis"),
          tags$style(
            HTML("
              .fluid-row {
                display: flex;
                justify-content: center;
                align-items: center;
              }
            ")
          ),
          fluidRow(
            column(3, div(class = "plot-container", plotlyoutput("piechartblack"))),
            column(3, div(class = "plot-container", plotlyoutput("piechartasian"))),
            column(3, div(class = "plot-container", plotlyoutput("piechartwhite"))),
            column(3, div(class = "plot-container", plotlyoutput("piechartother")))
          )
        )
      )
    )
  )
)
```

- 5) Generate output through server

```
# Define server logic
server <- function(input, output, session) {

  # Filter data based on selected ethnicity for word cloud
  filtered_wordcloud_data <- reactive({
    subset(London_Objects, officer.defined.ethnicity == input$cloudEthnicity)
  })

  # Filter data based on selected object of search for Sankey chart
  filtered_sankey_data <- reactive({
    subset(London_Objects, object.of.search %in% input$sankeySearch)
  })

  # Create word cloud based on filtered data
  output$wordcloud <- renderWordcloud2({
    create_wordcloud(filtered_wordcloud_data())
  })

  # Create Sankey chart based on filtered data
  output$sankeyplot <- renderSankeyPlot({
    create_sankeyplot(filtered_sankey_data())
  })
}
```

3.2 Interactive Narrative Visualisation Implementation

3.2.1 Tabs

There are two main tabs within the app. One for data visualisation with explanation and one for project background and details.

3.2.2 User friendly design

The graph that user hove over will be slightly emphasized and labels are clearly provided for each graph.

Additionally, the target node on the right hand side of the Sankey chart can be dragged to provide a clearer view.

For word cloud and Pie chart, dropdown selection for ethnicities is provided.

3.2.3 Word Explanation

Word explanation could be found under or beside each graph.

3.3 Using the Implementation

Overall, the visualisation project should be clear and easy to use. Please do not miss out on the "About the project" tab under the title next to the "Analysis" tab. (Location guide; see Section 5.2.1.)

To run this R Shiny app, I provide the code and the data used in the same folder. Please download the folder in your local PC's working directory in order to run smoothly.

Please refresh the page after clicking on full screen; the graph and word explanation location will adjust your screen size after refreshing.

4. Conclusion

From the visualisations, we can conclude that age, gender, and ethnicity have significant impacts on police officer's stop and search actions. Gender-wise, Asian females are the least likely to be identified as suspicious, and white females, even if they are most likely to be identified as suspicious among females, still only account for 40 percent of overall white searches. This indicates that when the police conduct search actions, they are most likely to choose males. For ethnicities other than white, the most likely age group to be searched is 18-24, while for the white race it is 25-34. Despite having a smaller population than Asians, individuals identified as Black by officers are still more likely to be searched than Asians. They are also most frequently searched for possessing offensive weapons, whereas the primary search reason for White and Other ethnicities is possession of stolen goods. The reasons for searches are more evenly distributed in the Asian group. From the search outcome, guilty rate for people with white ethnicity is more than five percent above all the other ethnicity group.

However, there are still some limitations to this project. Firstly, the dataset used contains significant number of missing values. In terms of geographical scope, this analysis focuses only on the London area and the findings may not be generalisable to other parts of the UK, as regional differences and population demographic might defer. Additionally, ethnicity categorisation, which is based on officer-defined categories, may not accurately reflect an individual's self-identification, which can introduce bias. Whilst the analysis reveals differences, it cannot be concluded that these biases necessarily exist as each individual is subjective in different ways. From an officer's perspective, any suspicious behaviour requires a search to maximise public safety. Further investigation such as policy analyses, will be required to understand the reasons for these results.
